WHAT'S A DEFIBRILLATOR (AED)?

An Automated External Defibrillator (AED) is a medical device that helps resuscitate victims of cardiac arrest. Accompanied by cardiac massage, the defibrillator helps to significantly increase the chances of survival.

Cardiac Arrest vs. Heart Attack

CARDIAC ARREST

is an
**ELECTRICAL
PROBLEM**

Cardiac arrest occurs when the heart stops beating suddenly and unexpectedly. The person has collapsed, is unresponsive, has no pulse and is making gasping sounds or is not breathing. Without intervention, brain cells can start to die within minutes.

HEART ATTACK

is a
**PLUMBING
PROBLEM**

Heart attack occurs when blood flow to part of the heart gets blocked. The person is usually conscious, has a pulse, and is short of breath but their heart is still beating. If blood flow isn't restored quickly, that part of the heart begins to die.

DIFFERENCE BETWEEN AN AUTOMATIC & SEMI-AUTOMATIC AED

For the automatic defibrillator, the rescuer turns on the device, places the electrodes on the victim and the machine takes care of the rest, delivering the shock if necessary without intervention by the rescuer. Regarding the semi-automatic defibrillator, the device specifies whether shock is indicated or not.

HOW TO USE A DEFIBRILLATOR ?

Starting the AED

Placement of THE electrodes

Heart rate analysis

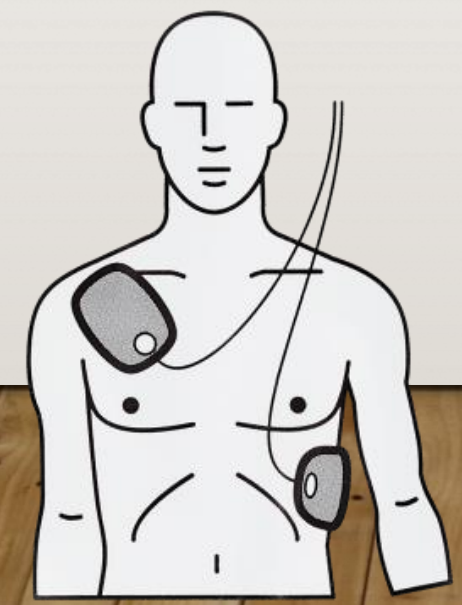

Administration of an electric shock and steps to take

How to place the electrodes ?

Here is where to place the electrodes on adults (and children aged 8 and/or weighing more than 25 kg).

Here is where to place the electrodes on children aged 1 to 8 years (and/or weighing less than 25 kg).
